ABSTRACT: The chemical structures of garuganin IV and 1,9'-didesmethylgaruganin III were misassigned. The structures were revised on the basis of analysis of the NMR data, and the revisions were verified through total synthesis.

The diarylether heptanoids (DAEHs) are a family of natural products characterized by an oxa[1.7]metaparacyclophane architecture. These natural products display a range of biological activities ${ }^{1}$ and have attracted interest from synthetic chemists. ${ }^{2}$ Sixteen DAEHs do not possess a stereocenter, but interestingly, some DAEHs are chiral. ${ }^{3,4}$ We recently investigated the relationship between DAEH structure and chirality. ${ }^{5}$ Two DAEHs, garuganin IV and $1,9^{\prime}$-didesmethylgaruganin III were independently isolated from Garuga pinnata as optically active compounds, ${ }^{4 \mathrm{~g}, \mathrm{~h}}$ and we recently published syntheses of the reported structures. ${ }^{5}$ However, analysis of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of these molecules revealed that the structures had been misassigned. We now report revised chemical structures for these two natural products. We have verified our assignments through total synthesis and established that the molecules are achiral.

The original assignment of garuganin IV (1) was based on chemical shift calculations and comparison with garugamblin I (2). The chemical shifts assigned to $\mathrm{H}_{2}$ and $\mathrm{H}_{4}$ were reported to be nearly the same (see Figure 1 for DAEH numbering ${ }^{6}$ ) and exhibited broadening at 250 and 500 MHz . As a result, values of the coupling constants were not reported. No

information was given regarding how the assignments of the individual resonances were made.

We prepared structure $\mathbf{1}^{5}$ and found that the spectral data for the synthetic material did not match the data for the natural substance. In an attempt to deduce the true structure of garuganin IV, we considered the NMR data reported for the compound. Proton $\mathrm{H}_{6}$ was present as evidenced by its diagnostic anisotropic upfield shift ( $\delta 5.30 \mathrm{ppm}$ ) resulting from the ring current of the adjacent phenyl ring. The ${ }^{1} \mathrm{H}$ NMR data also showed the existence of a para-substituted phenyl ring, four methylenes, and a vinylogous methyl ester. Furthermore, the geminal methylene protons were chemical shift inequivalent, which only occurs for E-configured vinylogous esters with the $\mathrm{C}_{9}$ carbonyl regioisomer. ${ }^{5}$ Natural garguanin IV was hydrolyzed to the corresponding vinylogous acid and assigned as $3,{ }^{4 \mathrm{~g}}$ which established the presence of the vinylogous ester functional group. Since we determined experimentally that the structure of garuganin IV was not structure 1, and since Sabata and co-workers reported that the structure was different than garugamblin $\mathrm{I},{ }^{4 \mathrm{~g}}$ we considered the only other isomeric possibility (5, Figure 1). We surmised that in the event that $\mathrm{H}_{2}$ and $\mathrm{H}_{3}$ were accidentally chemical shift equivalent, they would not experience $J$ coupling, and this would explain the observed shifts and coupling patters reported. Synthetically, vinylogous ester 5 was envisioned to arise from vinylogous acid 6 , which would allow us to prepare regio- and stereoisomers of 5 and compare the spectral data of 6 with the data reported for the hydrolysis product of natural garuganin IV (and assigned as structure 3).

To test this hypothesis, we prepared structure 5. The synthesis begins with known benzaldehyde 7 (Scheme 1). ${ }^{7}$ A standard three-step sequence gave hydrocinnamaldehyde 9 . Aldol addition of 9 to the lithium enolate derived from ketone

10 produced adduct 11. IBX-mediated oxidation ${ }^{8}$ and removal of the benzyl ether ${ }^{9}$ gives bromophenol 12. Ullmann cyclization ${ }^{10}$ of 12 gives 6 , which did not match the data reported for the hydrolysis product of the natural substance (assigned as 3). Furthermore, an unselective kinetic methylation of 6 gave 13 and $144^{2 a-c, 5}$ Neither $Z$-configured vinylogous ester 13 nor 14 matched the data reported for garuganin IV. Isomerization of 13 and 14 gave E-configured regioisomers 5 and 15, respectively. Neither of these structures had NMR data that matched the reported data for garuganin IV.

We then revisited the NMR data for garuganin IV. Table 1 shows the ${ }^{1} \mathrm{H}$ NMR chemical shifts and multiplicities (in
decreasing chemical shift order) reported for garuganin IV, along with the data for synthetic compounds $\mathbf{1}, 2$, and 5 . The aromatic region of the spectra ( $5.0-8.0 \mathrm{ppm}$ ) was most useful in the analysis because many of the signals upfield of 5.0 ppm were reported as overlapping multiplets. Inspection of the chemical shift values reveals that the compound isolated and named garuganin IV and garugamblin I (2) have ${ }^{1} \mathrm{H}$ chemical shifts that are nearly identical. Isomeric structures $\mathbf{1}$ and 5 do not match the reported data. Moreover, the ${ }^{13} \mathrm{C}$ NMR chemical shifts reported for garuganin IV match the shifts of 2 , and the reported data for $9^{\prime}$-desmethylgaruganin IV (originally assigned as 3 ) matches that of 4 . We believe that the material isolated and reported as garuganin IV is garugamblin I (2). Although
the natural sample was reported to be optically active, we have previously shown that this molecule is achiral. ${ }^{5}$

The assignment of $1,9^{\prime}$-didesmethylgaruganin III as structure 16 (Figure 2) was based on analysis of the 2D NMR data and

1,9'-didesmethylgaruganin III (16)

Figure 2. Reported structure of 1,9'-didesmethylgaruganin III and congeners. $\mathrm{CDCl}_{3}, 700 \mathrm{MHz} ;{ }^{1} \mathrm{H}$ NMR chemical shifts for selected methyl groups; ${ }^{13} \mathrm{C}$ NMR chemical shifts in parentheses.
on comparison with garuganin III (17). ${ }^{4 \mathrm{~h}}$ Specifically, the methyl ether was assigned on the basis of the HMBC correlation of the methyl protons to $\mathrm{C}_{3}$. We previously prepared structure 16 and found the data for the synthetic material did not match the natural product.

During the course of our synthesis of the garuganin and garugamblin DAEHs, we prepared a variety of closely related chemical structures and acquired their ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra. Selected structures are shown in Figure 2 along with some of their chemical shift data. As evidenced by the tablulated data, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shift ranges of all $\mathrm{C}_{3}$ bound methoxy groups are $3.81-3.88$ and $56.0-56.3 \mathrm{ppm}$, respectively. Furthermore, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts of the $\mathrm{C}_{2}$-bound methoxy groups are 3.97 and 61.2 ppm , respectively. The reported ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts of the methoxy group for the natural product assigned as $1,9^{\prime}$-didesmethylgaruganin III are 4.05 and 61.3 ppm , respectively. These data suggest that the true structure of the natural substance has the methoxy group at $\mathrm{C}_{2}$, and the structure of the natural product is 18 . We decided to synthesize structure 18 to verify our prediction.

The synthesis of 18 begins with known gallic acid derivative 19 (Scheme 2). ${ }^{11}$ Protection of the phenol and subsequent oxidation state change produced aldehyde 20. Intermediate 20 underwent Horner-Wadsworth-Emmons reaction and reduction to yield hydrocinnamate 21. Reduction, aldol addition, oxidation, and debenzylation gave bromophenol 22. Cyclization of 22 and removal of the isopropyl group leads to structure 18.

Gratifyingly, the spectral data for 18 matches the reported data for the natural product (Table 2). ${ }^{12}$ The chemical shifts of the protons associated with the tetrasubstituted ring are the most diagnostic. Specifically, the two aryl protons ( $\delta 6.37,5.15$ $\mathrm{ppm})$ match the data of 18 nearly exactly. Furthermore, the chemical shift of the methyl group ( $\delta 4.05 \mathrm{ppm}$ ) in 18 is a perfect match to the reported data. Finally, the reported ${ }^{13} \mathrm{C}$ NMR chemical shifts also match compound 18 and do not match the chemical shifts for 16.

Since the natural product is not appropriately named $1,9^{\prime}$ didesmethylgaruganin III with any of the various diarylether

heptanoid numbering schemes, we propose the name garuganin VII for this natural product to avoid confusion. Additionally, despite reported optical activity, the molecule displays enantiotopic geminal methylene protons, which indicates that it is an achiral molecule.

In conclusion, we have determined that the natural product assigned as garuganin IV is garugamblin I. The natural product assigned as $1,9^{\prime}$-didesmethylgaruganin III has structure 18, and we propose the name garuganin VII for structure 18. Finally, we previously showed that garugamblin I is achiral, and since garuganin VII has enantiotopic geminal methylene protons, we conclude that this structure is also achiral, despite the optical activities reported for the natural substances.

## EXPERIMENTAL SECTION

General Experimental Details. All reactions were carried out under an inert Ar atmosphere in oven-dried glassware. External bath temperatures were used to record all reaction mixture temperatures. All combined organic extracts were dried over $\mathrm{MgSO}_{4}$. Column chromatography was carried out with SiliaFlash P60 silica gel. Thin layer chromatography was performed using Silica Gel 60 plates. Tetrahydrofuran (THF), methylene chloride $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ and acetonitrile ( MeCN ) were dried by passage through activated alumina columns. DMF and DMSO were stored over $3 \AA$ molecular sieves. Pyridine $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{~N}\right)$ and diisopropylamine were distilled from $\mathrm{CaH}_{2}$. All other reagents and solvents were used without further purification from commercial sources. FT-IR spectra were obtained as thin films on NaCl plates. Proton and carbon NMR spectra ( ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$

NMR) were recorded in deuterated chloroform $\left(\mathrm{CDCl}_{3}\right)$ at 700 or 400 MHz as indicated. Melting points are uncorrected.

3-(5-(Benzyloxy)-2-methoxyphenyl)propanal (9). To a slurry of $\mathrm{NaH}(216 \mathrm{mg}, 5.4 \mathrm{mmol})$ in THF $(10 \mathrm{~mL}, 0.2 \mathrm{M})$ at $0{ }^{\circ} \mathrm{C}$ was slowly added methyl 2-(diethoxyphosphoryl)acetate (991 $\mu \mathrm{L}, 5.4$ mmol ) over a period of 10 min . After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , a solution of 5-(benzyloxy)-2-methoxybenzaldehyde ${ }^{13}$ ( $872 \mathrm{mg}, 3.6$ mmol ) in THF ( 8 mL ) was added. The mixture was warmed to rt and stirred at rt for 30 min . To the above reaction mixture were added $\mathrm{H}_{2} \mathrm{O}(18 \mathrm{~mL}), \mathrm{NaOAc}(1.181 \mathrm{~g}, 14.4 \mathrm{mmol})$ and a solution of $\mathrm{TsNHNH}_{2}(2.011 \mathrm{~g}, 10.8 \mathrm{mmol})$ in THF $(18 \mathrm{~mL})$ over a period of 30 $\min$ at $80^{\circ} \mathrm{C}$. The mixture was stirred for 24 h and then allowed to cool to rt. The organic phase was separated, and the aqueous phase was extracted with EtOAc. Purification by flash column chromatography (hexanes: $\mathrm{EtOAc}=10: 1$ to $8: 1$ ) gave methyl 3-(5-(benzyloxy)-2methoxyphenyl)propanoate (S1, $1.07 \mathrm{~g}, 3.56 \mathrm{mmol}, 99 \%$ yield, 2 steps) as a light yellow solid. 7-(5-(Benzyloxy)-2-methoxyphenyl)-1-(4-bromophenyl)-5-hydroxyheptan-3-one (11). To a solution of diisopropylamine (316 $\mathrm{mg}, 3.12 \mathrm{mmol})$ in THF $(13 \mathrm{~mL}, 0.1 \mathrm{M})$ at $0{ }^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}$ $(1.95 \mathrm{~mL}, 3.12 \mathrm{mmol}, 1.6 \mathrm{M}$ in hexane) over a period of 10 min . After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , the mixture was cooled to $-78{ }^{\circ} \mathrm{C}$. A solution of 4-(4-bromophenyl)butan-2-one ${ }^{14}$ ( $681 \mathrm{mg}, 3 \mathrm{mmol}$ ) in THF ( 6 mL ) was added over a period of 30 min . After stirring at -78 ${ }^{\circ} \mathrm{C}$ for 30 min , a solution of aldehyde $9(676 \mathrm{mg}, 2.5 \mathrm{mmol})$ in THF $(6 \mathrm{~mL})$ was added over a period of 30 min . The reaction was quenched with saturated aqueous Rochelle's salt at -78 ${ }^{\circ} \mathrm{C}$ and warmed to rt. The organic phase was separated, and the inorganic phase was extracted with EtOAc. Purification by flash column chromatography (hexanes:EtOAc $=5: 1$ ) gave 3-(3-(benzyl-oxy)-5-isopropoxy-4-methoxyphenyl)propanal (S3, $1.022 \mathrm{~g}, 3.11$ $\mathrm{mmol}, 84 \%$ yield) as a light yellow oil. Data for S3: $R_{f} 0.61$ (2:1 hexanes:EtOAc); IR (thin film) 2976, 1723, 1588, 1503, 1435, 1237, 1117, $1010 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(700 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.78(\mathrm{t}, J=1.4 \mathrm{~Hz}, 1$ H), 7.46-7.29 (m, 5H), $6.43(\mathrm{~s}, 2 \mathrm{H}), 5.10(\mathrm{~s}, 2 \mathrm{H}), 4.52(\mathrm{sept}, J=$ $6.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 2.84(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.71(\mathrm{td}, J=7.5$, $1.1 \mathrm{~Hz}, 2 \mathrm{H}), 1.35(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(176 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, HSQC, DEPT) $\delta$ C 152.6, 151.7, 138.9, 137.2, 135.6; CH 201.4, 128.4, 127.7, 127.2, 109.9, 108.0, 71.6; $\mathrm{CH}_{2} 71.2,45.2,28.2 ; \mathrm{CH}_{3} 60.6,22.2$; HRMS (EI+) calcd for $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{4}$ [M] 328.1675, found 328.1672.

To a solution of diisopropylamine ( $253 \mathrm{mg}, 2.5 \mathrm{mmol}$ ) in THF ( 8 $\mathrm{mL}, 0.1 \mathrm{M})$ was added $n$ - $\mathrm{BuLi}(1.56 \mathrm{~mL}, 2.5 \mathrm{mmol}, 1.6 \mathrm{M}$ in hexane) over a period of 10 min at $0^{\circ} \mathrm{C}$. After stirring at $0^{\circ} \mathrm{C}$ for 30 min , the mixture was cooled to $-78{ }^{\circ} \mathrm{C}$. A solution of 4 -(4-bromophenyl)-butan-2-one ( $545 \mathrm{mg}, 2.4 \mathrm{mmol}$ ) in THF ( 6 mL ) was added over a period of 30 min . After stirring at $-78^{\circ} \mathrm{C}$ for 30 min , a solution of 3-(3-(benzyloxy)-5-isopropoxy-4-methoxyphenyl)propanal ( $657 \mathrm{mg}, 2$ $\mathrm{mmol})$ in THF ( 6 mL ) was added over a period of 30 min . After 2 h , the reaction was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$. The organic phase was separated, and the inorganic phase was extracted with EtOAc. Purification by flash column chromatography (hexane$\mathrm{s}:$ EtOAc $=5: 1$ to $3: 1$ ) gave 7-(3-(benzyloxy)-5-isopropoxy-4-methoxyphenyl)-1-(4-bromophenyl)-5-hydroxyheptan-3-one (S4, 808 $\mathrm{mg}, 1.45 \mathrm{mmol}, 73 \%$ yield) as a colorless oil. To a solution of 7-(3-(benzyloxy)-5-isopropoxy-4-methoxyphenyl)-1-(4-bromophenyl)-5-hydroxyheptan-3-one ( $389 \mathrm{mg}, 0.7 \mathrm{mmol}$ ) in $\mathrm{EtOAc}(7 \mathrm{~mL}, 0.1 \mathrm{M})$ at rt was added IBX ( $588 \mathrm{mg}, 2.1 \mathrm{mmol}$ ). The reaction mixture was heated to reflux for 4 h . The mixture was cooled to rt , filtered through a pad of silica gel, and concentrated to give 1-(3-(benzyloxy)-5-isopropoxy-4-methoxyphenyl)-7-(4-bromophenyl)-heptane-3,5-dione, which was used without further purification.

To a stirred solution of 1-(3-(benzyloxy)-5-isopropoxy-4-methox-yphenyl)-7-(4-bromophenyl)heptane-3,5-dione (from above, approximately 0.7 mmol$)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(14 \mathrm{~mL}, 0.05 \mathrm{M})$ were added pentamethylbenzene $(311 \mathrm{mg}, 2.1 \mathrm{mmol})$ and $\mathrm{BCl}_{3}(2.8 \mathrm{~mL}, 2.8$ mmol, 1 M in DCM) at $-78^{\circ} \mathrm{C}$ over a period of 10 min . The reaction was quenched with MeOH at $-78^{\circ} \mathrm{C}$. The mixture was warmed to rt. Diluted aqueous $\mathrm{NaHCO}_{3}$ was added until the aqueous phase had pH 6. The organic phase was separated, and the aqueous phase was extracted with EtOAc. Purification by flash column chromatography (hexanes: $\mathrm{EtOAc}=5: 1$ to $3: 1$ ) gave $22(227 \mathrm{mg}, 0.49 \mathrm{mmol}, 70 \%$ yield, 2 steps) as a light yellow oil. Data for 22: $R_{f} 0.56$ (2:1 Hexanes:EtOAc); IR (thin film) 3432 (br), 2976, 2932, 1592, 1507, 1489, 1368, 1330, 1195, 1115, 1073, $1011 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( 700 MHz , $\mathrm{CDCl}_{3}$, enol tautomer) $\delta 15.41(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.39(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$, $7.05(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 6.40(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.28(\mathrm{~d}, J=1.9 \mathrm{~Hz}$,

Garuganin VII (18). To a sealed tube were added 22 ( 23.2 mg , $0.05 \mathrm{mmol}), \mathrm{CuO}(9.9 \mathrm{mg}, 0.125 \mathrm{mmol})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(13.8 \mathrm{mg}, 0.1$ $\mathrm{mmol})$. The tube was evacuated and backfilled with Ar , followed by the addition of pyridine $(10 \mathrm{~mL}, 0.005 \mathrm{M})$. The tube was then sealed and heated at $130{ }^{\circ} \mathrm{C}$ for 48 h . The mixture was cooled to rt. After evaporation of the solvent, aqueous $\mathrm{HCl}(1 \mathrm{~mL}, 1 \mathrm{M})$ and $\mathrm{H}_{2} \mathrm{O}$ (5 mL ) were added. The mixture was extracted with EtOAc. Purification by flash column chromatography (hexanes:EtOAc $=8: 1$ to $6: 1$ ) gave isopropylgaruganin VII (S5, $8.6 \mathrm{mg}, 0.0225 \mathrm{mmol}, 45 \%$ yield) as a light yellow solid.
